

Core

Deadline: Sunday of Week 3

Difficulty Level: Intermediate

Est. Time: 2 - 3 hrs

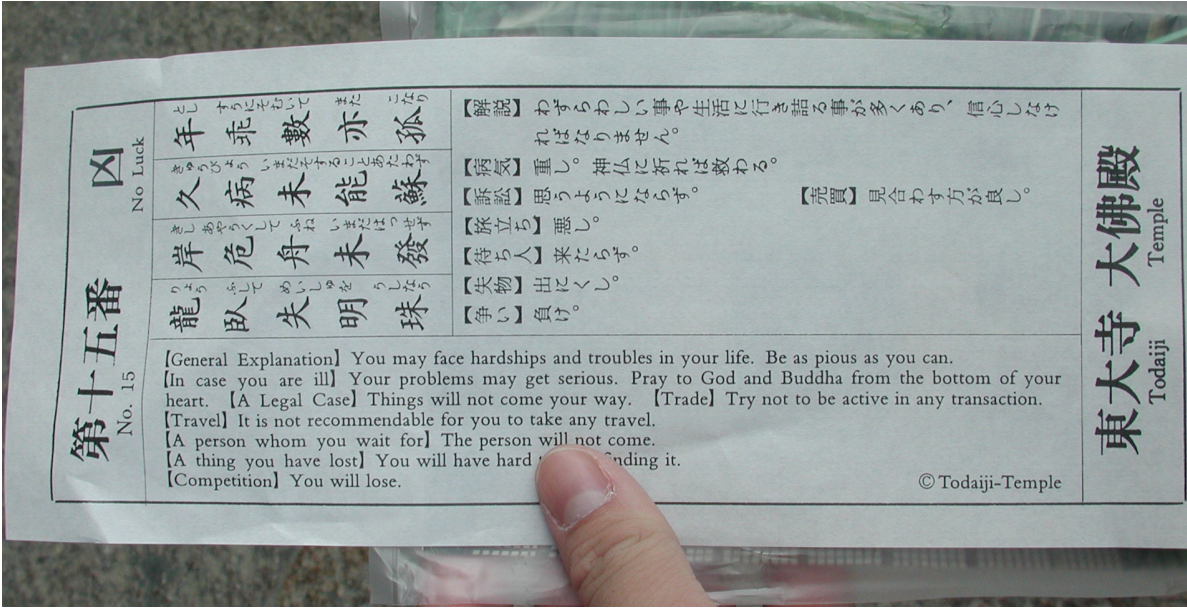

Omikuji Form

Omikuji (おみくじ) is a form of fortune telling written on small pieces of paper. Because they are chosen at random from many boxes of fortunes, one can only hope that their fortune will reveal good luck. In order to provide your friends with better odds, you will make an Omikuji app that will produce fortunes based on questions you ask them, so that their fortune will never be like the one below!

Learning Objectives:

- Get more comfortable with POST and passing information via a form
- Be completely comfortable referencing static CSS
- Note the importance of making your key assignments/projects look better
- Understand why rendering HTML on a URL that received a POST is a bad idea

Assignment:

For this assignment you may either create a new project or add this functionality to your Daikichi Assignment. You'll be adding 3 more routes, JSP, JSTL and static content.

The routes you will need:

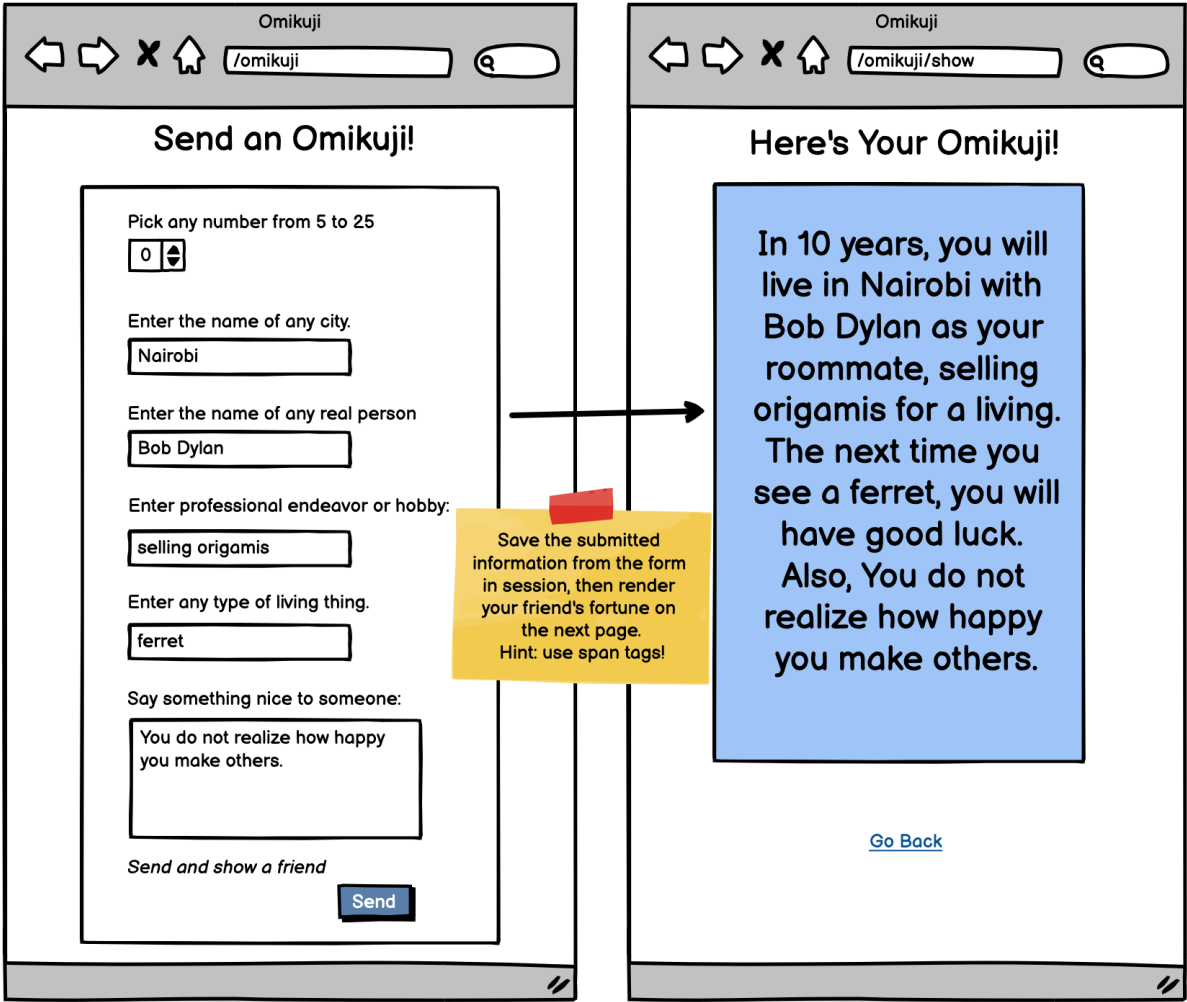

1. A route to render the home page that shows the Omikuji form
2. A POST route to process the form when the user hits "send"
3. A route to render their fortune
